

Dental Patient Report – Tooth Cavity Case (Sample)

Patient Information

Patient Name: John Doe

Age / Gender: 28 Years / Male

Patient ID: DEN-2026-1045

Date of Visit: 06 May 2026

Consulting Dentist: Dr. Emily Carter, BDS, MDS

Chief Complaint

Patient reports sensitivity and intermittent pain in the lower right molar region while consuming cold beverages and sweets for the past 2 months.

Medical History

- No major systemic illness reported.
- No known drug allergies.
- Not currently on medication.

Dental Examination

Clinical Findings:

- Visible blackish-brown carious lesion observed on tooth #46.
- Mild plaque accumulation present.
- Tenderness absent on percussion.

Radiographic Findings:

- Dental X-ray reveals proximal dental caries involving enamel and dentin.
- No periapical infection detected.
- Pulp chamber appears unaffected.

Diagnosis

Primary Diagnosis: Dental Caries (Class II Cavity) involving Tooth #46.

Severity: Moderate.

Treatment Plan

1. Removal of decayed tooth structure.
2. Composite tooth-colored filling restoration.
3. Oral hygiene counseling.
4. Follow-up after 6 months.

Prescribed Medications

Medicine	Dosage	Duration
Ibuprofen 400mg	SOS after meals	3 days
Chlorhexidine Mouthwash	Twice daily	7 days

Oral Hygiene Instructions

- Brush twice daily using fluoride toothpaste.
- Avoid excessive sugary foods and beverages.
- Floss regularly.
- Routine dental checkup every 6 months.

Prognosis

Good, provided proper oral hygiene and timely restoration are maintained.
